

Supplementary Figure 1. Distinct localization of leptin- and resistin- vesicles in 3T3-L1 adipocytes revealed by confocal imaging. (A) 3T3-L1 adipocytes overexpressed with leptin-EGFP were fixed, permeabilized, and immunostained with the rabbit anti-resistin primary antibody and the secondary antibody conjugated with Atto-647. (B) 3T3-L1 adipocytes overexpressed with resistin-EGFP were fixed, permeabilized, and immunostained with rabbit anti-leptin primary antibody and the secondary antibody conjugated with Atto-647.
