Supplemental Figure 2

The graph shows the levels of Prolactin (ng/mL) in two different groups, Aip +/+ and Aip +/-, at two different time points: 3 months and 12 mois. The y-axis represents Prolactin levels in ng/mL, and the x-axis represents the time points. The bars indicate the mean values, with error bars showing the standard deviation. The number of samples in each group is indicated above the bars: 15 and 18 for Aip +/+ at 3 months, and 16 and 20 for Aip +/- at 12 mois. The graph suggests a difference in Prolactin levels between the two groups at 3 months but not at 12 mois.
